

MERAB SAMKHARADZE

Angular Developer — Angular · TypeScript · JavaScript (ES2015+) · RxJS / NgRx · HTML5 / CSS3

+995 598 487 787 | samkharadzemerab@gmail.com | [linkedin.com/in/merab-samkharadze-15301b131](https://www.linkedin.com/in/merab-samkharadze-15301b131) | Tbilisi, Georgia

PROFESSIONAL SUMMARY

Angular developer with **2+ years** of professional web development, currently shipping Angular in two live products at the same time: a promotions platform with **100k+ active users** and a cross-border HealthTech marketplace. Daily work spans **Angular v14–v21** — RxJS, NgRx, Signals, standalone components, lazy loading and OnPush change detection — on top of modern **JavaScript (ES2015+)** and **TypeScript** in strict mode, with semantic **HTML5** and **SCSS/BEM** front ends that hold up in every supported browser. Apply **OOP and SOLID** beyond the client layer too: production REST APIs in Node.js, a NestJS service layer, and **SQL** schemas I design, index and tune myself. Unit-test with **Jest** and Vitest, and review every pull request before it reaches main.

TECHNICAL SKILLS

Angular: Angular v14–v21 · RxJS · NgRx · Signals · Standalone Components · Reactive Forms · Router & Lazy Loading · OnPush Change Detection · Dependency Injection · HttpClient & Interceptors · Angular CLI · PrimeNG · SPA architecture

JavaScript & TypeScript: JavaScript ES2015+ and latest ECMAScript specs · TypeScript (strict) · Promises & async/await · Classes, Modules & Prototypes · Closures · Generics & Utility Types · optional chaining / nullish coalescing · immutable data patterns

HTML & CSS: Semantic HTML5 · CSS3 · SCSS · BEM · Flexbox · CSS Grid · mobile-first responsive design · cross-browser compatibility · Tailwind CSS · Figma / Zeplin hand-off

OOP & Architecture: OOP principles (encapsulation, abstraction, inheritance, polymorphism) · SOLID · design patterns · modular architecture · component-based design · DTO validation · code review

Testing: Jest · Vitest · Angular TestBed · unit testing · test-suite maintenance

Databases & APIs: SQL · PostgreSQL · MySQL · relational schema design · joins, indexing & query optimisation · migrations · REST API design & integration · WebSockets · JWT & role-based auth · Node.js · NestJS · Postman

Methodologies & Tools: Agile teamwork · Git feature-branch flow · pull-request review · SPA / SSR / SSG · internationalisation (i18n) · accessibility · WebStorm / VS Code · npm / yarn | *familiar: Storybook, Nx workspace, MS SQL / T-SQL*

WORK EXPERIENCE

Angular Developer — MedSocial

06/2026 – Present

Remote · HealthTech marketplace · run in parallel with the Crocobet role · medsocial.online

- Joined an **Angular 21 / TypeScript-strict** codebase another developer had been building for 3.5 months and wrote **45% of the source in 5 weeks** — 81 commits, 207 files touched, 42 created, all merged to main through reviewed pull requests.
- Built the entire 1:1 doctor–patient chat over **WebSockets**: transport with subprotocol auth and reconnect backoff, optimistic send, presence, typing indicators, an offline outbox and gap healing over REST.
- Cut the listings page from a **7.9–9.4s blank screen to 0ms** and requests before first paint from 6 to 1, by measuring the load first and then deleting two calls that cost 7 seconds and served no purpose.
- Migrated a site containing one @media rule to a four-tier **responsive** system with shared breakpoints and a matchMedia service, reviewing each tier and fixing 27 defects before release.
- Rebuilt the auth chain with functional HTTP interceptors — one token refresh per 401 with the other failed requests queued behind it, plus proactive refresh scheduled from the JWT exp claim.
- Took the **unit-test suite from 33 failing spec files to fully green** — 78 files, 104 tests.

Angular Developer — Crocobet

07/2025 – Present

Tbilisi, Georgia · Promotions & campaigns platform

- Own the **Angular (v14+)** front end of a platform with **100k+ active users**, built with TypeScript, RxJS and **NgRx** for real-time campaign state shared consistently across every view.
- Shipped **20+ campaign UIs** end-to-end from design hand-off to production — several running simultaneously — each on a launch date fixed before the work started.
- Built and maintain a shared library of **50+ responsive components** in SCSS BEM, Flexbox and CSS Grid, with full cross-browser compatibility.
- Cut initial load time across the **5 heaviest modules** with lazy-loaded feature modules and OnPush change detection.
- Wrote the production **REST APIs in Node.js** behind campaign workflows where that was faster than waiting for them, so the client–service contract was designed once.
- Keep a **5-person team's** codebase release-ready by reviewing every pull request before merge.

Tbilisi, Georgia · Hotel & restaurant management platform

- Took the front end from an empty repository to a live product for **3+ business clients** — bookings, menus, orders and role-based admin dashboards — in Next.js, React, TypeScript and SCSS.
- Reduced page load times by **25%** by removing unnecessary re-renders and refactoring component trees that had grown too deep.
- Cut post-release bugs by **15%** by introducing structured debugging practices and making **code review mandatory** before every merge to main.
- Specified and integrated **10+ REST endpoints** with the backend team, enabling real-time booking updates and role-based access control; ran bi-weekly knowledge-sharing sessions for 4 developers.

PROJECTS

Full-Stack Application — Angular + NestJS + SQL *(personal project)*

- Structured the NestJS API around **OOP fundamentals** — encapsulated services, interface-driven providers and constructor injection throughout — with DTO classes and decorator-based validation guarding every request contract.
- Designed a normalised **relational schema** and wrote the queries against it: multi-table joins, indexes and aggregate reporting; JWT authentication with role-based guards on every protected route.

dasaqmdi.com — Bilingual Job Board *(live product, sole author of 291 commits)*

- Authored the complete **PostgreSQL** schema alone: 37 migrations, 53 row-level security policies across 14 tables, 8 triggers and 34 indexes, serving seeker, employer and administrator roles.
- Replaced an unindexed five-column ILIKE chain with a weighted tsvector and a **GIN index**, turning full-text search into an indexed lookup.
- Designed, built and shipped the whole product alongside full-time work: 45 pages, 143 components, 271 pages pre-rendered, shared First Load JS held at 102 kB.

EDUCATION & TRAINING

React with Next.js Framework — TBC IT Academy, Tbilisi | 09/2024 – 01/2025 — 3 full-stack projects; component architecture, SSR/SSG; +30% page performance.

JavaScript & Node.js (Advanced) — Academy of Digital Industries, Tbilisi | 05/2024 – 08/2024 — 80+ hrs: closures, prototypes, Promises, async/await, OOP.

Master's Degree — International Economics — Tbilisi State University | 09/2021 – 06/2023 — econometrics, statistical modelling, applied mathematics.

Bachelor's Degree — Economics — Tbilisi State University | 09/2016 – 06/2021

LANGUAGES

Georgian — Native | **English** — Professional working proficiency

SELECTED STRENGTHS

Multiple projects at once: two live Angular products in parallel — Crocobet and MedSocial — plus a product of my own built and shipped to production. Nothing slipped in either.

Priorities that hold: 20+ campaigns delivered on dates fixed before the work started; at MedSocial I audited the codebase into a prioritised 551-line backlog and closed 48 items from it in five weeks.

Analytical, and independent with it: proved a WebSocket 1006 failure was a server-side specification violation by reproducing it with curl and a Node client when browser DevTools could not show it — then wrote a measurement script instead of guessing, which is how the 7 seconds of pointless page load were found.
